

Module	Intervention	Placebo
Module 1	- Participants develop intrinsic motivation by identifying personal values and future aspirations, enhancing treatment readiness and reducing resistance to change. - They learn to recognize cognitive distortions and impulsivity, improving decision-making by weighing long-term consequences over immediate rewards. - Through structured goal-setting techniques, participants transform abstract desires into specific, measurable, and achievable objectives, increasing self-efficacy and behavioral clarity. - The module integrates goal implementation into reoffending prevention, reinforcing consistent behavior, coping strategies, and supervision awareness to support sustained rehabilitation.	- Participants gain insight into the benefits of physical activity, identify personal barriers, and set achievable goals to build motivation for physical activity. - They develop foundational motor skills, coordination, and balance, enhancing physical confidence and improving participation in daily and therapeutic activities. - Through mindfulness and adaptive exercises, participants strengthen cognitive and emotional flexibility, reducing rigidity and improving resilience to stress. - Practical strategies are introduced to break sedentary patterns, increasing awareness of health risks and promoting sustainable, active living for long-term well-being.
Module 2	- Participants develop skills to build trust and collaborative working relationships with probation officers, reducing resistance and improving adherence to supervision mandates. - They identify trauma- and fear-based avoidance patterns that interfere with engagement, using cognitive-behavioral strategies to enhance compliance with structured interventions. - Through guided reflection, participants examine the impact of adult relationships on emotional regulation and behavioral stability, targeting deficits in capacity for adult intimacy. - They learn evidence-based techniques to recognize and disengage from negative social influences while cultivating prosocial, emotionally supportive relationships to sustain long-term reintegration.	- Participants learn the basics of muscle structure and function, increasing self-awareness of physical capabilities and enhancing motivation to engage in structured physical routines. - Using the Rubicon model, they explore intrinsic and extrinsic motivators, identifying barriers like low confidence or time constraints that affect adherence and relationship-building. - By reflecting on personal sport preferences, participants recognize how peer or cultural influences may shape physical activity choices, reducing susceptibility to negative social pressures. - They gain accurate knowledge of exercise's physiological benefits, including mood-enhancing effects and age-related misconceptions, fostering long-term commitment to healthy habits.
Module 3	- Participants learn to identify emotions as indicators of unmet needs, reducing impulsive reactions by linking affective states to underlying psychological demands. - Through mindfulness exercises and case examples, they develop non-reactive awareness of emotions and bodily sensations, improving impulse control and reducing maladaptive coping. - They distinguish between emotional experiences and action urges using tools like the tension scale, fostering pause-and-reflect strategies to interrupt impulsive behaviors. - By creating personalized skill sets, participants build adaptive, individualized responses to emotional distress, enhancing long-term emotional regulation and self-management.	- Participants learn how sleep quality directly influences emotional regulation, cognitive function, and physical health, addressing impulsivity and emotional dysregulation that undermine sleep hygiene. - Understanding sleep cycles and physiological restoration helps link poor sleep to heightened stress, supporting those with external or sexualized coping patterns in developing healthier responses. - Practical, non-drug strategies are taught to manage shift work and jetlag, promoting consistent routines and environmental adjustments that support long-term sleep stability. - Discussion of sleep disorders like apnea emphasizes their impact on health and

		relationships, encouraging proactive, evidence-based lifestyle changes over medication reliance.
Module 4	- Participants learn to recognize problem-solving deficits as a core component of self-regulation difficulties, understanding that challenges are manageable through structured, cognitive-behavioral approaches. - They are taught the 7-Step Problem-Solving Plan to systematically identify, define, and address problems, enhancing decision-making and reducing impulsive or avoidant reactions. - Through video examples and case studies, participants practice distinguishing between changeable and unchangeable issues, generating realistic solutions, and evaluating outcomes. - The module fosters cognitive restructuring and emotional regulation by linking problem-solving to adaptive coping, promoting long-term self-regulation and behavioral control.	- Participants explore the neuroscience of dreaming, including REM and non-REM sleep stages, to understand how disrupted sleep impairs cognitive flexibility. - Through mindfulness, dream journaling, and symbolic interpretation, they develop reflective practices that enhance self-awareness. - The module links stress, sleep disruption, and dream content, illustrating how chronic stress undermines executive function and exacerbates difficulties in structured thinking and solution generation. - Case studies highlight trauma-related dream patterns, showing how unresolved psychological distress and poor sleep hinder insight and cognitive restoration, reinforcing the need for integrated sleep and emotional care.
Module 5	- Participants learn to identify three out of 16 offense-supportive cognitive distortions, such as rationalizations that minimize harm, which perpetuate antisocial thinking and increase reoffending risk. - They explore how these distortions arise from selective attention to partial truths, reinforcing denial and minimizing consequences through psychological defense mechanisms. - Through psychoeducation and cognitive restructuring, participants challenge distorted beliefs using evidence-based techniques, promoting critical evaluation of harmful thought patterns. - Case studies and video examples illustrate real-world consequences of distorted thinking, bridging the gap between perceived justification and actual harm, enhancing insight and accountability.	- Participants gain foundational knowledge of nutrition, digestion, and the mind-body connection, challenging offense-supportive beliefs by linking healthy eating to self-control and well-being. - Through case studies and interactive exercises, they explore ethical, health, and environmental motivations for plant-based diets, fostering empathy and prosocial decision-making. - Awareness of key nutrients and deficiency risks promotes informed choices, countering misinformation and supporting mental clarity and emotional stability. - Practical skills in meal planning and grocery shopping build confidence and sustainability, empowering lasting dietary changes that enhance psychological health and reduce behavioral risk.
Module 6	- Participants learn to differentiate between healthy and problematic sexual interests, recognizing how sexual preoccupation increases reoffending risk and undermines abstinence. - The module addresses emotional congruence with children as a key risk factor, emphasizing the importance of maintaining emotional and physical boundaries to reduce relapse potential. - Cognitive restructuring techniques are used to challenge distorted beliefs about sexual behavior, fostering insight and promoting adaptive, non-harmful thought patterns.	- Well-being is understood as a holistic, individualized experience integrating physical, psychological, and social health, rooted in emotional fulfillment, resilience, and meaningful connections. - Participants challenge the myth of universal well-being, recognizing its subjective nature and the importance of personal values, identity, and life context in shaping health and satisfaction. - Through interactive learning, participants explore the gut-brain axis, mindful eating, and hygiene practices, linking nutrition, self-care, and bodily awareness to mental clarity and psychological stability.

Module	Intervention	Placebo
	Through identification of high-risk triggers and personalized coping strategies, participants enhance self-regulation, self-efficacy, and control over problematic sexual urges.	Psychological well-being is distinguished from happiness, focusing on meaning, inner balance, and personal growth, explored through reflections on identity, nature, music, and laughter.
